### **Abstract :**

Let R be a commutative ring with unity . In this paper we study R-modules which satisfy self-C - injective modules.

### **المستخلص**

لتن R زمرة ابدال ذات محايد . في هذا البحث ندرس المقاسات التي تحقق المقاس من النمط المغلق الشبه اغماري

### **Introduction :**

Let R be a commutative ring with unity and M be an R- module. An R-module M is said to be self – C-injective module , if for each N closed sub module of M , and for each R-homomorphism  $f : N \rightarrow M$  can be extended to  $g: M \rightarrow M$  {[6],[7]}

We study the relation between self –C- injective and other well – known concepts as semi-injective module,  $\square$ - injective , continuous module and quasi – injective module.

First , we give the following proposition .

Proposition 1: Let M be a self –C- injective R-module such that for any A,B closed in M ,A+B is closed in MR , then  $\text{ann}_s(A \cap B) = \text{ann}_s(A) + \text{ann}_s(B)$  , where  $\text{ann}_s(X) = \{s \in R : sX = 0\}$  and  $S = \text{End}_R(M)$ .

### **Proof:-**

Let  $f \in \text{ann}_s(A \cap B)$  ,A,B are closed sub module thus  $f \in S$  and  $f(A \cap B) = 0$

Consider the diagram

$$\begin{array}{ccc} A+B & \rightarrow & M \\ \downarrow f & & \downarrow \mu \\ M & & M \end{array}$$

Since A,B are closed , so A+B is closed ,

hence  $f_f$  can be extended to  $\mu : M \rightarrow M$  such that  $\mu \circ i = f_f$ .

Since M is self – C-injective by assumption so  $f_f(a+b) = f(a)$ ,

for any  $a \in A$  and  $b \in B$  ,  $\mu \circ i(a+b) = f_f(a+b)$

$$\mu(a+b) = f(a)$$

$$\mu(a) + \mu(b) = f(a)$$

$$(f - \mu)(a) + \mu(b) = 0$$

But  $f - \mu \in \text{anns}(A)$ , since  $(f - \mu)(a) = 0$

for any  $a \in A$  and  $\mu \in \text{anns}(B)$ , since  $\mu(b) = 0$

$$= f_f(0+b)$$

$$= f(0)$$

There fore  $f = (f - \mu) + \mu \in \text{ann}_s(A) + \text{ann}_s(B)^*$

Recall that , M satisfies C1 ,if every sub module is essential in a direct summand.

**Proposition (2)** Every module that satisfies C1-condition is self – C-injective

### **Proof:-**

Assume M satisfies C1, then every closed sub module of M is a direct sum and by [(5),prop2.4, p.20] .

Thus for every closed sub- module  $N$  of  $M$ , there exists a sub- module  $W$  of  $M$  such that  $M = N + W$ .  
Let  $f : N \rightarrow M$  be any  $R$ -homomorphism.

$$F(x), \quad x \in N;$$

Define  $g: M \rightarrow M$  by  $g(x) = \begin{cases} f(x) & \text{if } x \in N \\ 0 & \text{otherwise} \end{cases}$ .

It is easy to check that  $g$  is an  $R$ -homomorphism and  $g \circ i = f$ .

Thus  $M$  is self  $-C$ - injective  $R$ -module \*

**Example (3) [2, lemma(101), p.61]**

Let  $M$  be an  $R$ - module whose lattice of sub- modules is:

$$N_1$$

$$(o) \quad N_1 + N_2 \rightarrow M$$

$$N_2$$

where  $N_1$  is not iso- morphic to  $N_2$ .

$N_1$  and  $N_2$  are closed sub- module of  $M$ , to show that  $N_1$  has no proper essential extension in  $M$

$N_1 \leq N_1 + N_2$ , but  $N_2 \not\leq N_1 + N_2$  and  $N_1 \cap N_2 = (0)$

So  $N_1 \leq N_1 + N_2$

Similarly,  $N_2 \leq N_1 + N_2$ , but  $N_1$  and  $N_2$  are not direct summand of  $M$ , hence  $M$  does not satisfy  $C_1$ , and  $N_1 + N_2 \leq M$ , thus  $N_1 + N_2$  is not closed.

**Remark (4):**

$M$  in example (3) is not self  $-C$ - injective module. Recall that, a right  $R$ - module  $M$  is called an Ikeda – Nakayama module (briefly  $M_R$  is an IN-module) If  $Ls(A \wedge B) = Ls(A) + Ls(B)$  for any sub- modules  $A$  and  $B$  of  $M_R$ , where  $S = \text{End}(M)$  and  $Ls(X) = \{s \in S : sX = 0\}$  for any sub- module  $X$  of  $M_R$ . [ 9 ]

**Proposition (5)**

Every IN –module is self  $-C$ - injective module .

Proof:- Since every IN –module is  $\prod$  injective module ( $C_1 + C_3$ ), so by proposition (2),  $M$  is self  $-C$ - injective \*

An  $R$ - module  $M$  is called continuous if it satisfies  $C_1$  and  $C_2$

where  $M$  is said to be satisfy  $C_1$ , if every sub- module is essential in a direct summand and  $M$  satisfies  $C_2$  if every sub- module isomorphic to a direct summand is itself a direct summand of  $M$ . And  $M$  is called quasi –continuous ( $\prod$ - injective) if  $C_1$  holds and if for any two direct summand  $M_1, M_2$  of  $M$  with  $M_1 \cap M_2 = (0)$ ,  $M_1 + M_2$  is also a direct summand of  $M$   $C_3$  [ 5 ], DEF(2.3), P.18 ]

**proposition (6):-**

**Every continuous module is self-  $C$ - injective module \***

**Proof:-**

Since  $M$  is continuous ( $C_1 + C_2$ ), so by prop (2)

$M$  is self  $-C$ - injective module \*

**Proposition(7):-**

Every  $\prod$ - injective ( quasi – continuous) module is self  $-C$ - injective module.

Proof: Since  $M$  is  $\prod$ - injective ( $C_1 + C_3$ ), so by prop (2)

$M$  is self  $-C$ - injective module \*

Recall that, an  $R$  –module  $M$  is said to be semi –injective, if for each sub module  $N$  of  $M$ , every  $R$  – homomorphism  $f: N \rightarrow N$  can be extended to an  $R$ - homomorphism  $g: M \rightarrow M$  [8]

**Proposition (8).**

Every semi –injective module is self –C- injective module . Proof. Since by [1 , cor(9.3), p.85 ] every semi – injective is  $\square$ - injective (C1+C3) , thus by prop .(2) M is self –C- injective \* Recall that , an R-module M is uniform if  $M \neq 0$  and every non Zero sub module of M is essential in M [ 3 , p.85 ] . Thus every uniform module satisfies C1- condition , and by prop .(2), M is self – C-injective . Now, we have the following An R-module M is said to be semi simple module, if every sub- module is a direct summand ( 4 )

**Proposition (9).**

Every semi simple module is self –C- injective module .

Proof. Since every semi simple module is quasi-injective module and every quasi –injective module is  $\square$ -injective( C1+C3), thus by prop (2), M is self –C-injective\*
